MFT My Funky Thesis

DEFINITIONS

S

STUDENT is an entity needing a thesis to transcend the state of being a student.

INTRODUCTION

1.1 BACKGROUND

Given data from many hours of recordings which contains whale noises at undetermined times is difficult to analyse where these whale sounds occur at a glance. This is of interest as researchers can use this information to determine the migration patterns of whales and other behaviours.

1.2 PROBLEM STATEMENT

Determine whether the method of Dynamic Time Warping (DTW) can be successfully used to find whale sounds within large amounts of data. When the data used is in the form of feature vectors instead of scalars.

1.3 OBJECTIVES

Three different feature extraction methods will be used to extract the features needed from the data. These features methods will be Short Time Fourier Transform (STFT), Mel-frequency Cepstral Coefficients (MFCC) and Linear Predictive Coding (LPC).

Dynamic Time Warping (DTW) will be used for detection and classification of the feature vectors extracted using the different methods. This will be tested against a dataset which is labeled to determine whether the DTW method actually works correctly.

The reason for the different feature extraction methods is to show that the DTW method is not dependent on the feature extraction method used.

WELCOME TO ENGINEERING

Figure 1.1: Your figure caption.

1.4 THESIS OVERVIEW

Write a good thesis and follow the instructions at [1]. The pukka $\text{\LaTeX}$ template for Stellenbosch Theses is available at [2], this one is just for dummies.

My funky thesis (MFT) is as good as MFT can be, as Table 1.1 and Figure 1.1 shows. Have a look at my explanation in Section 2.1 on page 3, which is in Chapter 2.
